

## **LOW COST MANUFACTURE OF OLIGOSACCHARIDES**

5

### **ABSTRACT OF THE DISCLOSURE**

This invention provides recombinant cells, reaction mixtures, and methods that are useful for the enzymatic synthesis of product saccharides. The recombinant cells contain a heterologous gene that encodes a glycosyltransferase which catalyzes at least one step of the enzymatic synthesis, as well as a system for generating a nucleotide sugar that

10 can serve as a substrate for the glycosyltransferase.
